

[PHP]

.....

; About php.ini ;

.....

; PHP's initialization file, generally called php.ini, is responsible for
; configuring many of the aspects of PHP's behavior.

; PHP attempts to find and load this configuration from a number of locations.

; The following is a summary of its search order:

; 1. SAPI module specific location.

; 2. The PHPRC environment variable.

; 3. A number of predefined registry keys on Windows

; 4. Current working directory (except CLI)

; 5. The web server's directory (for SAPI modules), or directory of PHP

; (otherwise in Windows)

; 6. The directory from the --with-config-file-path compile time option, or the

; Windows directory (usually C:\windows)

; See the PHP docs for more specific information.

; <https://php.net/configuration.file>

; The syntax of the file is extremely simple. Whitespace and lines

; beginning with a semicolon are silently ignored (as you probably guessed).

; Section headers (e.g. [Foo]) are also silently ignored, even though

; they might mean something in the future.

; Directives following the section heading [PATH=/www/mysite] only

; apply to PHP files in the /www/mysite directory. Directives

; following the section heading [HOST=www.example.com] only apply to

; PHP files served from www.example.com. Directives set in these
; special sections cannot be overridden by user-defined INI files or
; at runtime. Currently, [PATH=] and [HOST=] sections only work under
; CGI/FastCGI.
; <https://php.net/ini.sections>

; Directives are specified using the following syntax:

; directive = value

; Directive names are *case sensitive* - foo=bar is different from FOO=bar.

; Directives are variables used to configure PHP or PHP extensions.

; There is no name validation. If PHP can't find an expected

; directive because it is not set or is mistyped, a default value will be used.

; The value can be a string, a number, a PHP constant (e.g. E_ALL or M_PI), one

; of the INI constants (On, Off, True, False, Yes, No and None) or an expression

; (e.g. E_ALL & ~E_NOTICE), a quoted string ("bar"), or a reference to a

; previously set variable or directive (e.g. \${foo})

; Expressions in the INI file are limited to bitwise operators and parentheses:

; | bitwise OR

; ^ bitwise XOR

; & bitwise AND

; ~ bitwise NOT

; ! boolean NOT

; Boolean flags can be turned on using the values 1, On, True or Yes.

; They can be turned off using the values 0, Off, False or No.

; An empty string can be denoted by simply not writing anything after the equal

; sign, or by using the None keyword:

; foo = ; sets foo to an empty string

; foo = None ; sets foo to an empty string

; foo = "None" ; sets foo to the string 'None'

; If you use constants in your value, and these constants belong to a

; dynamically loaded extension (either a PHP extension or a Zend extension),

; you may only use these constants *after* the line that loads the extension.

.....

; About this file ;

.....

; PHP comes packaged with two INI files. One that is recommended to be used

; in production environments and one that is recommended to be used in

; development environments.

; php.ini-production contains settings which hold security, performance and

; best practices at its core. But please be aware, these settings may break

; compatibility with older or less security-conscious applications. We

; recommending using the production ini in production and testing environments.

; php.ini-development is very similar to its production variant, except it is

; much more verbose when it comes to errors. We recommend using the

; development version only in development environments, as errors shown to

; application users can inadvertently leak otherwise secure information.

; This is the php.ini-development INI file.

.....
.....

; Quick Reference ;

.....
.....

; The following are all the settings which are different in either the production

; or development versions of the INIs with respect to PHP's default behavior.

; Please see the actual settings later in the document for more details as to why

; we recommend these changes in PHP's behavior.

; display_errors

; Default Value: On

; Development Value: On

; Production Value: Off

; display_startup_errors

; Default Value: On

; Development Value: On

; Production Value: Off

; error_reporting

; Default Value: E_ALL

; Development Value: E_ALL

; Production Value: E_ALL & ~E_DEPRECATED & ~E_STRICT

; log_errors

; Default Value: Off

; Development Value: On

; Production Value: On

; max_input_time
; Default Value: -1 (Unlimited)
; Development Value: 60 (60 seconds)
; Production Value: 60 (60 seconds)

; output_buffering
; Default Value: Off
; Development Value: 4096
; Production Value: 4096

; register_argc_argv
; Default Value: On
; Development Value: Off
; Production Value: Off

; request_order
; Default Value: None
; Development Value: "GP"
; Production Value: "GP"

; session.gc_divisor
; Default Value: 100
; Development Value: 1000
; Production Value: 1000

; session.sid_bits_per_character
; Default Value: 4
; Development Value: 5
; Production Value: 5

; session.sid_length

; Default Value: 32

; Development Value: 26

; Production Value: 26

; short_open_tag

; Default Value: On

; Development Value: Off

; Production Value: Off

; variables_order

; Default Value: "EGPCS"

; Development Value: "GPCS"

; Production Value: "GPCS"

; zend.assertions

; Default Value: 1

; Development Value: 1

; Production Value: -1

; zend.exception_ignore_args

; Default Value: Off

; Development Value: Off

; Production Value: On

; zend.exception_string_param_max_len

; Default Value: 15

; Development Value: 15

; Production Value: 0

//////////

; php.ini Options ;

//////////

; Name for user-defined php.ini (.htaccess) files. Default is ".user.ini"

;user_ini.filename = ".user.ini"

; To disable this feature set this option to an empty value

;user_ini.filename =

; TTL for user-defined php.ini files (time-to-live) in seconds. Default is 300 seconds (5 minutes)

;user_ini.cache_ttl = 300

//////////

; Language Options ;

//////////

; Enable the PHP scripting language engine under Apache.

; <https://php.net/engine>

engine = On

; This directive determines whether or not PHP will recognize code between

; <? and ?> tags as PHP source which should be processed as such. It is

; generally recommended that <?php and ?> should be used and that this feature

; should be disabled, as enabling it may result in issues when generating XML

; documents, however this remains supported for backward compatibility reasons.

; Note that this directive does not control the <?=> shorthand tag, which can be

; used regardless of this directive.

; Default Value: On

; Development Value: Off

; Production Value: Off

; <https://php.net/short-open-tag>

short_open_tag = Off

; The number of significant digits displayed in floating point numbers.

; <https://php.net/precision>

precision = 14

; Output buffering is a mechanism for controlling how much output data

; (excluding headers and cookies) PHP should keep internally before pushing that

; data to the client. If your application's output exceeds this setting, PHP

; will send that data in chunks of roughly the size you specify.

; Turning on this setting and managing its maximum buffer size can yield some

; interesting side-effects depending on your application and web server.

; You may be able to send headers and cookies after you've already sent output

; through print or echo. You also may see performance benefits if your server is

; emitting less packets due to buffered output versus PHP streaming the output

; as it gets it. On production servers, 4096 bytes is a good setting for performance

; reasons.

; Note: Output buffering can also be controlled via Output Buffering Control

; functions.

; Possible Values:

; On = Enabled and buffer is unlimited. (Use with caution)

; Off = Disabled

; Integer = Enables the buffer and sets its maximum size in bytes.

; Note: This directive is hardcoded to Off for the CLI SAPI

; Default Value: Off

; Development Value: 4096
; Production Value: 4096
; <https://php.net/output-buffering>
output_buffering = 4096

; You can redirect all of the output of your scripts to a function. For
; example, if you set output_handler to "mb_output_handler", character
; encoding will be transparently converted to the specified encoding.
; Setting any output handler automatically turns on output buffering.
; Note: People who wrote portable scripts should not depend on this ini
; directive. Instead, explicitly set the output handler using ob_start().
; Using this ini directive may cause problems unless you know what script
; is doing.
; Note: You cannot use both "mb_output_handler" with "ob_iconv_handler"
; and you cannot use both "ob_gzhandler" and "zlib.output_compression".
; Note: output_handler must be empty if this is set 'On' !!!!
; Instead you must use zlib.output_handler.
; <https://php.net/output-handler>
;output_handler =

; URL rewriter function rewrites URL on the fly by using
; output buffer. You can set target tags by this configuration.
; "form" tag is special tag. It will add hidden input tag to pass values.
; Refer to session.trans_sid_tags for usage.
; Default Value: "form="

; Development Value: "form="

; Production Value: "form="

;url_rewriter.tags

; URL rewriter will not rewrite absolute URL nor form by default. To enable
; absolute URL rewrite, allowed hosts must be defined at RUNTIME.
; Refer to session.trans_sid_hosts for more details.
; Default Value: ""
; Development Value: ""
; Production Value: ""
;url_rewriter.hosts

; Transparent output compression using the zlib library
; Valid values for this option are 'off', 'on', or a specific buffer size
; to be used for compression (default is 4KB)
; Note: Resulting chunk size may vary due to nature of compression. PHP
; outputs chunks that are few hundreds bytes each as a result of
; compression. If you prefer a larger chunk size for better
; performance, enable output_buffering in addition.
; Note: You need to use zlib.output_handler instead of the standard
; output_handler, or otherwise the output will be corrupted.
; <https://php.net/zlib.output-compression>
zlib.output_compression = Off

; <https://php.net/zlib.output-compression-level>
;zlib.output_compression_level = -1

; You cannot specify additional output handlers if zlib.output_compression
; is activated here. This setting does the same as output_handler but in
; a different order.
; <https://php.net/zlib.output-handler>
;zlib.output_handler =

; Implicit flush tells PHP to tell the output layer to flush itself
; automatically after every output block. This is equivalent to calling the
; PHP function flush() after each and every call to print() or echo() and each
; and every HTML block. Turning this option on has serious performance
; implications and is generally recommended for debugging purposes only.
; <https://php.net/implicit-flush>
; Note: This directive is hardcoded to On for the CLI SAPI
implicit_flush = Off

; The unserialize callback function will be called (with the undefined class'
; name as parameter), if the unserializer finds an undefined class
; which should be instantiated. A warning appears if the specified function is
; not defined, or if the function doesn't include/implement the missing class.
; So only set this entry, if you really want to implement such a
; callback-function.
unserialize_callback_func =

; The unserialize_max_depth specifies the default depth limit for unserialized
; structures. Setting the depth limit too high may result in stack overflows
; during unserialization. The unserialize_max_depth ini setting can be
; overridden by the max_depth option on individual unserialize() calls.
; A value of 0 disables the depth limit.
unserialize_max_depth = 4096

; When floats & doubles are serialized, store serialize_precision significant
; digits after the floating point. The default value ensures that when floats
; are decoded with unserialize, the data will remain the same.
; The value is also used for json_encode when encoding double values.
; If -1 is used, then dtoa mode 0 is used which automatically select the best

; precision.

serialize_precision = -1

; open_basedir, if set, limits all file operations to the defined directory

; and below. This directive makes most sense if used in a per-directory

; or per-virtualhost web server configuration file.

; Note: disables the realpath cache

; <https://php.net/open-basedir>

;open_basedir =

; This directive allows you to disable certain functions.

; It receives a comma-delimited list of function names.

; <https://php.net/disable-functions>

disable_functions =

; This directive allows you to disable certain classes.

; It receives a comma-delimited list of class names.

; <https://php.net/disable-classes>

disable_classes =

; Colors for Syntax Highlighting mode. Anything that's acceptable in

; would work.

; <https://php.net/syntax-highlighting>

;highlight.string = #DD0000

;highlight.comment = #FF9900

;highlight.keyword = #007700

;highlight.default = #0000BB

;highlight.html = #000000

; If enabled, the request will be allowed to complete even if the user aborts
; the request. Consider enabling it if executing long requests, which may end up
; being interrupted by the user or a browser timing out. PHP's default behavior
; is to disable this feature.
; <https://php.net/ignore-user-abort>
;ignore_user_abort = On

; Determines the size of the realpath cache to be used by PHP. This value should
; be increased on systems where PHP opens many files to reflect the quantity of
; the file operations performed.
; Note: if open_basedir is set, the cache is disabled
; <https://php.net/realpath-cache-size>
;realpath_cache_size = 4096k

; Duration of time, in seconds for which to cache realpath information for a given
; file or directory. For systems with rarely changing files, consider increasing this
; value.
; <https://php.net/realpath-cache-ttl>
;realpath_cache_ttl = 120

; Enables or disables the circular reference collector.
; <https://php.net/zend.enable-gc>
zend.enable_gc = On

; If enabled, scripts may be written in encodings that are incompatible with
; the scanner. CP936, Big5, CP949 and Shift_JIS are the examples of such
; encodings. To use this feature, mbstring extension must be enabled.
;zend.multibyte = Off

; Allows to set the default encoding for the scripts. This value will be used
; unless "declare(encoding=...)" directive appears at the top of the script.
; Only affects if zend.multibyte is set.
zend.script_encoding =

; Allows to include or exclude arguments from stack traces generated for exceptions.
; In production, it is recommended to turn this setting on to prohibit the output
; of sensitive information in stack traces
; Default Value: Off
; Development Value: Off
; Production Value: On
zend.exception_ignore_args = Off

; Allows setting the maximum string length in an argument of a stringified stack trace
; to a value between 0 and 1000000.
; This has no effect when zend.exception_ignore_args is enabled.
; Default Value: 15
; Development Value: 15
; Production Value: 0
zend.exception_string_param_max_len = 15

//////////

; Miscellaneous ;

//////////

; Decides whether PHP may expose the fact that it is installed on the server
; (e.g. by adding its signature to the Web server header). It is no security
; threat in any way, but it makes it possible to determine whether you use PHP
; on your server or not.

; <https://php.net/expose-php>

expose_php = On

.....

; Resource Limits ;

.....

; Maximum execution time of each script, in seconds

; <https://php.net/max-execution-time>

; Note: This directive is hardcoded to 0 for the CLI SAPI

max_execution_time = 30

; Maximum amount of time each script may spend parsing request data. It's a good

; idea to limit this time on productions servers in order to eliminate unexpectedly

; long running scripts.

; Note: This directive is hardcoded to -1 for the CLI SAPI

; Default Value: -1 (Unlimited)

; Development Value: 60 (60 seconds)

; Production Value: 60 (60 seconds)

; <https://php.net/max-input-time>

max_input_time = 60

; Maximum input variable nesting level

; <https://php.net/max-input-nesting-level>

;max_input_nesting_level = 64

; How many multipart body parts (combined input variable and file uploads) may
; be accepted.

; Default Value: -1 (Sum of max_input_vars and max_file_uploads)

;max_multipart_body_parts = 1500

; Maximum amount of memory a script may consume

; <https://php.net/memory-limit>

memory_limit = 128M

;;;;;;;;;;;;;;;;

; Error handling and logging ;

;;;;;;;;;;;;;;;;

; This directive informs PHP of which errors, warnings and notices you would like

; it to take action for. The recommended way of setting values for this

; directive is through the use of the error level constants and bitwise

; operators. The error level constants are below here for convenience as well as

; some common settings and their meanings.

; By default, PHP is set to take action on all errors, notices and warnings EXCEPT

; those related to E_NOTICE and E_STRICT, which together cover best practices and

; recommended coding standards in PHP. For performance reasons, this is the

; recommend error reporting setting. Your production server shouldn't be wasting

; resources complaining about best practices and coding standards. That's what

; development servers and development settings are for.

; Note: The php.ini-development file has this setting as E_ALL. This

; means it pretty much reports everything which is exactly what you want during

; development and early testing.

;

; Error Level Constants:

```
; E_ALL          - All errors and warnings
; E_ERROR        - fatal run-time errors
; E_RECOVERABLE_ERROR - almost fatal run-time errors
; E_WARNING      - run-time warnings (non-fatal errors)
; E_PARSE        - compile-time parse errors
; E_NOTICE       - run-time notices (these are warnings which often result
;                from a bug in your code, but it's possible that it was
;                intentional (e.g., using an uninitialized variable and
;                relying on the fact it is automatically initialized to an
;                empty string)
; E_STRICT       - run-time notices, enable to have PHP suggest changes
;                to your code which will ensure the best interoperability
;                and forward compatibility of your code
; E_CORE_ERROR   - fatal errors that occur during PHP's initial startup
; E_CORE_WARNING - warnings (non-fatal errors) that occur during PHP's
;                initial startup
; E_COMPILE_ERROR - fatal compile-time errors
; E_COMPILE_WARNING - compile-time warnings (non-fatal errors)
; E_USER_ERROR   - user-generated error message
; E_USER_WARNING - user-generated warning message
; E_USER_NOTICE  - user-generated notice message
; E_DEPRECATED   - warn about code that will not work in future versions
;                of PHP
; E_USER_DEPRECATED - user-generated deprecation warnings
;
; Common Values:
; E_ALL (Show all errors, warnings and notices including coding standards.)
; E_ALL & ~E_NOTICE (Show all errors, except for notices)
; E_ALL & ~E_NOTICE & ~E_STRICT (Show all errors, except for notices and coding standards warnings.)
```

; E_COMPILE_ERROR|E_RECOVERABLE_ERROR|E_ERROR|E_CORE_ERROR (Show only errors)
; Default Value: E_ALL
; Development Value: E_ALL
; Production Value: E_ALL & ~E_DEPRECATED & ~E_STRICT
; <https://php.net/error-reporting>
error_reporting = E_ALL

; This directive controls whether or not and where PHP will output errors,
; notices and warnings too. Error output is very useful during development, but
; it could be very dangerous in production environments. Depending on the code
; which is triggering the error, sensitive information could potentially leak
; out of your application such as database usernames and passwords or worse.
; For production environments, we recommend logging errors rather than
; sending them to STDOUT.

; Possible Values:

; Off = Do not display any errors
; stderr = Display errors to STDERR (affects only CGI/CLI binaries!)
; On or stdout = Display errors to STDOUT

; Default Value: On

; Development Value: On

; Production Value: Off

; <https://php.net/display-errors>

display_errors = On

; The display of errors which occur during PHP's startup sequence are handled
; separately from display_errors. We strongly recommend you set this to 'off'
; for production servers to avoid leaking configuration details.

; Default Value: On

; Development Value: On

; Production Value: Off
; <https://php.net/display-startup-errors>
display_startup_errors = On

; Besides displaying errors, PHP can also log errors to locations such as a
; server-specific log, STDERR, or a location specified by the error_log
; directive found below. While errors should not be displayed on productions
; servers they should still be monitored and logging is a great way to do that.
; Default Value: Off
; Development Value: On
; Production Value: On
; <https://php.net/log-errors>
log_errors = On

; Do not log repeated messages. Repeated errors must occur in same file on same
; line unless ignore_repeated_source is set true.
; <https://php.net/ignore-repeated-errors>
ignore_repeated_errors = Off

; Ignore source of message when ignoring repeated messages. When this setting
; is On you will not log errors with repeated messages from different files or
; source lines.
; <https://php.net/ignore-repeated-source>
ignore_repeated_source = Off

; If this parameter is set to Off, then memory leaks will not be shown (on
; stdout or in the log). This is only effective in a debug compile, and if
; error reporting includes E_WARNING in the allowed list
; <https://php.net/report-memleaks>

report_memleaks = On

; This setting is off by default.

;report zend_debug = 0

; Turn off normal error reporting and emit XML-RPC error XML

; <https://php.net/xmlrpc-errors>

;xmlrpc_errors = 0

; An XML-RPC faultCode

;xmlrpc_error_number = 0

; When PHP displays or logs an error, it has the capability of formatting the

; error message as HTML for easier reading. This directive controls whether

; the error message is formatted as HTML or not.

; Note: This directive is hardcoded to Off for the CLI SAPI

; <https://php.net/html-errors>

;html_errors = On

; If html_errors is set to On *and* docref_root is not empty, then PHP

; produces clickable error messages that direct to a page describing the error

; or function causing the error in detail.

; You can download a copy of the PHP manual from <https://php.net/docs>

; and change docref_root to the base URL of your local copy including the

; leading '/'. You must also specify the file extension being used including

; the dot. PHP's default behavior is to leave these settings empty, in which

; case no links to documentation are generated.

; Note: Never use this feature for production boxes.

; <https://php.net/docref-root>

; Examples

```
;docref_root = "/phpmanual/"
```

```
; https://php.net/docref-ext
```

```
;docref_ext = .html
```

; String to output before an error message. PHP's default behavior is to leave

; this setting blank.

```
; https://php.net/error-prepend-string
```

; Example:

```
;error_prepend_string = "<span style='color: #ff0000'>"
```

; String to output after an error message. PHP's default behavior is to leave

; this setting blank.

```
; https://php.net/error-append-string
```

; Example:

```
;error_append_string = "</span>"
```

; Log errors to specified file. PHP's default behavior is to leave this value

; empty.

```
; https://php.net/error-log
```

; Example:

```
;error_log = php_errors.log
```

; Log errors to syslog (Event Log on Windows).

```
;error_log = syslog
```

; The syslog ident is a string which is prepended to every message logged

; to syslog. Only used when error_log is set to syslog.

```
;syslog.ident = php
```

; The syslog facility is used to specify what type of program is logging

; the message. Only used when error_log is set to syslog.

;syslog.facility = user

; Set this to disable filtering control characters (the default).

; Some loggers only accept NVT-ASCII, others accept anything that's not

; control characters. If your logger accepts everything, then no filtering

; is needed at all.

; Allowed values are:

; ascii (all printable ASCII characters and NL)

; no-ctrl (all characters except control characters)

; all (all characters)

; raw (like "all", but messages are not split at newlines)

; <https://php.net/syslog.filter>

;syslog.filter = ascii

;windows.show_crt_warning

; Default value: 0

; Development value: 0

; Production value: 0

//////////

; Data Handling ;

//////////

; The separator used in PHP generated URLs to separate arguments.

; PHP's default setting is "&".

; <https://php.net/arg-separator.output>

; Example:

```
;arg_separator.output = "&";
```

; List of separator(s) used by PHP to parse input URLs into variables.

; PHP's default setting is "&".

; NOTE: Every character in this directive is considered as separator!

; <https://php.net/arg-separator.input>

; Example:

```
;arg_separator.input = ";&"
```

; This directive determines which super global arrays are registered when PHP starts up. G,P,C,E & S are abbreviations for the following respective super globals: GET, POST, COOKIE, ENV and SERVER. There is a performance penalty paid for the registration of these arrays and because ENV is not as commonly used as the others, ENV is not recommended on production servers. You can still get access to the environment variables through `getenv()` should you need to.

; Default Value: "EGPCS"

; Development Value: "GPCS"

; Production Value: "GPCS";

; <https://php.net/variables-order>

```
variables_order = "GPCS"
```

; This directive determines which super global data (G,P & C) should be registered into the super global array REQUEST. If so, it also determines the order in which that data is registered. The values for this directive are specified in the same manner as the `variables_order` directive, EXCEPT one. Leaving this value empty will cause PHP to use the value set in the `variables_order` directive. It does not mean it will leave the super

```
; globals array REQUEST empty.  
; Default Value: None  
; Development Value: "GP"  
; Production Value: "GP"  
; https://php.net/request-order  
request_order = "GP"
```

```
; This directive determines whether PHP registers $argv & $argc each time it  
; runs. $argv contains an array of all the arguments passed to PHP when a script  
; is invoked. $argc contains an integer representing the number of arguments  
; that were passed when the script was invoked. These arrays are extremely  
; useful when running scripts from the command line. When this directive is  
; enabled, registering these variables consumes CPU cycles and memory each time  
; a script is executed. For performance reasons, this feature should be disabled  
; on production servers.
```

```
; Note: This directive is hardcoded to On for the CLI SAPI
```

```
; Default Value: On  
; Development Value: Off  
; Production Value: Off  
; https://php.net/register-argc-argv  
register_argc_argv = Off
```

```
; When enabled, the ENV, REQUEST and SERVER variables are created when they're  
; first used (Just In Time) instead of when the script starts. If these  
; variables are not used within a script, having this directive on will result  
; in a performance gain. The PHP directive register_argc_argv must be disabled  
; for this directive to have any effect.
```

```
; https://php.net/auto-globals-jit  
auto_globals_jit = On
```

; Whether PHP will read the POST data.

; This option is enabled by default.

; Most likely, you won't want to disable this option globally. It causes \$_POST

; and \$_FILES to always be empty; the only way you will be able to read the

; POST data will be through the php://input stream wrapper. This can be useful

; to proxy requests or to process the POST data in a memory efficient fashion.

; <https://php.net/enable-post-data-reading>

enable_post_data_reading = Off

; Maximum size of POST data that PHP will accept.

; Its value may be 0 to disable the limit. It is ignored if POST data reading

[Session]
; Handler used to store/retrieve data.
; <https://php.net/session.save-handler>
session.save_handler = files

; Argument passed to save_handler. In the case of files, this is the path
; where data files are stored. Note: Windows users have to change this
; variable in order to use PHP's session functions.

;

; The path can be defined as:

;

; session.save_path = "N;/path"

;

; where N is an integer. Instead of storing all the session files in

```
; /path, what this will do is use subdirectories N-levels deep, and
; store the session data in those directories. This is useful if
; your OS has problems with many files in one directory, and is
; a more efficient layout for servers that handle many sessions.
;
; NOTE 1: PHP will not create this directory structure automatically.
; You can use the script in the ext/session dir for that purpose.
; NOTE 2: See the section on garbage collection below if you choose to
; use subdirectories for session storage
;
; The file storage module creates files using mode 600 by default.
; You can change that by using
;
; session.save_path = "N;MODE;/path"
;
; where MODE is the octal representation of the mode. Note that this
; does not overwrite the process's umask.

; Development Value: 1

; Production Value: 1

; <https://php.net/session.gc-probability>

session.gc_probability = 1

; Defines the probability that the 'garbage collection' process is started on every
; session initialization. The probability is calculated by using gc_probability/gc_divisor,
; e.g. 1/100 means there is a 1% chance that the GC process starts on each request.
; For high volume production servers, using a value of 1000 is a more efficient approach.
; Default Value: 100
; Development Value: 1000
; Production Value: 1000
; <https://php.net/session.gc-divisor>
session.gc_divisor = 1000

; After this number of seconds, stored data will be seen as 'garbage' and
; cleaned up by the garbage collection process.
; <https://php.net/session.gc-maxlifetime>
session.gc_maxlifetime = 1440

; NOTE: If you are using the subdirectory option for storing session files
; (see session.save_path above), then garbage collection does *not*
; happen automatically. You will need to do your own garbage
; collection through a shell script, cron entry, or some other method.
; For example, the following script is the equivalent of setting
; session.gc_maxlifetime to 1440 (1440 seconds = 24 minutes):
; find /path/to/sessions -cmin +24 -type f | xargs rm

; Check HTTP Referer to invalidate externally stored URLs containing ids.
; HTTP_REFERER has to contain this substring for the session to be
; considered as valid.
; <https://php.net/session.referer-check>
session.referer_check =

; Set to {nocache,private,public,} to determine HTTP caching aspects

; or leave this empty to avoid sending anti-caching headers.

; <https://php.net/session.cache-limiter>

`session.cache_limiter = nocache`

[opcache]

; Determines if Zend OPCache is enabled

;opcache.enable=1

; Determines if Zend OPCache is enabled for the CLI version of PHP

;opcache.enable_cli=0

; The OPcache shared memory storage size.

;opcache.memory_consumption=128

; The amount of memory for interned strings in Mbytes.

;opcache.interned_strings_buffer=8

; The maximum number of keys (scripts) in the OPcache hash table.

; Only numbers between 200 and 1000000 are allowed.

;opcache.max_accelerated_files=10000

; The maximum percentage of "wasted" memory until a restart is scheduled.

;opcache.max_wasted_percentage=5

; When this directive is enabled, the OPcache appends the current working

; directory to the script key, thus eliminating possible collisions between

; files with the same name (basename). Disabling the directive improves

; performance, but may break existing applications.

;opcache.use_cwd=1

; When disabled, you must reset the OPcache manually or restart the
; webserver for changes to the filesystem to take effect.

;opcache.validate_timestamps=1

; How often (in seconds) to check file timestamps for changes to the shared
; memory storage allocation. ("1" means validate once per second, but only
; once per request. "0" means always validate)

;opcache.revalidate_freq=2

; Enables or disables file search in include_path optimization

;opcache.revalidate_path=0

; If disabled, all PHPDoc comments are dropped from the code to reduce the
; size of the optimized code.

;opcache.save_comments=1

; If enabled, compilation warnings (including notices and deprecations) will
; be recorded and replayed each time a file is included. Otherwise, compilation
; warnings will only be emitted when the file is first cached.

;opcache.record_warnings=0

; Allow file existence override (file_exists, etc.) performance feature.

;opcache.enable_file_override=0

; A bitmask, where each bit enables or disables the appropriate OPcache
; passes

;opcache.optimization_level=0x7FFFBFFF

;opcache.dups_fix=0

; The location of the OPcache blacklist file (wildcards allowed).
; Each OPcache blacklist file is a text file that holds the names of files
; that should not be accelerated. The file format is to add each filename
; to a new line. The filename may be a full path or just a file prefix
; (i.e., /var/www/x blacklists all the files and directories in /var/www
; that start with 'x'). Line starting with a ; are ignored (comments).
;opcache.blacklist_filename=

; Allows exclusion of large files from being cached. By default all files
; are cached.
;opcache.max_file_size=0

; How long to wait (in seconds) for a scheduled restart to begin if the cache
; is not being accessed.
;opcache.force_restart_timeout=180

; OPcache error_log file name. Empty string assumes "stderr".
;opcache.error_log=

; All OPcache errors go to the Web server log.
; By default, only fatal errors (level 0) or errors (level 1) are logged.
; You can also enable warnings (level 2), info messages (level 3) or
; debug messages (level 4).
;opcache.log_verbosity_level=1

; Preferred Shared Memory back-end. Leave empty and let the system decide.
;opcache.preferred_memory_model=

; Protect the shared memory from unexpected writing during script execution.

; Useful for internal debugging only.

;opcache.protect_memory=0

; Allows calling OPcache API functions only from PHP scripts which path is

; started from specified string. The default "" means no restriction

;opcache.restrict_api=

; Mapping base of shared memory segments (for Windows only). All the PHP

; processes have to map shared memory into the same address space. This

; directive allows to manually fix the "Unable to reattach to base address"

; errors.

;opcache.mmap_base=

; Facilitates multiple OPcache instances per user (for Windows only). All PHP

; processes with the same cache ID and user share an OPcache instance.

;opcache.cache_id=

; Enables and sets the second level cache directory.

; It should improve performance when SHM memory is full, at server restart or

; SHM reset. The default "" disables file based caching.

;opcache.file_cache=

; Enables or disables opcode caching in shared memory.

;opcache.file_cache_only=0

; Enables or disables checksum validation when script loaded from file cache.

;opcache.file_cache_consistency_checks=1

; Implies opcache.file_cache_only=1 for a certain process that failed to
; reattach to the shared memory (for Windows only). Explicitly enabled file
; cache is required.

;opcache.file_cache_fallback=1

; Enables or disables copying of PHP code (text segment) into HUGE PAGES.
; Under certain circumstances (if only a single global PHP process is
; started from which all others fork), this can increase performance
; by a tiny amount because TLB misses are reduced. On the other hand, this
; delays PHP startup, increases memory usage and degrades performance
; under memory pressure - use with care.
; Requires appropriate OS configuration.

;opcache.huge_code_pages=0

; Validate cached file permissions.

;opcache.validate_permission=0

; Prevent name collisions in chroot'ed environment.

;opcache.validate_root=0

; If specified, it produces opcode dumps for debugging different stages of
; optimizations.

;opcache.opt_debug_level=0

; Specifies a PHP script that is going to be compiled and executed at server
; start-up.

; <https://php.net/opcache.preload>

;opcache.preload=

; Preloading code as root is not allowed for security reasons. This directive
; facilitates to let the preloading to be run as another user.
; https://php.net/opcache.preload_user
;opcache.preload_user=

; Prevents caching files that are less than this number of seconds old. It
; protects from caching of incompletely updated files. In case all file updates
; on your site are atomic, you may increase performance by setting it to "0".
;opcache.file_update_protection=2

; Absolute path used to store shared lockfiles (for *nix only).
;opcache.lockfile_path=/tmp

[curl]

; A default value for the CURLOPT_CAINFO option. This is required to be an
; absolute path.
;curl.cainfo =

[openssl]

; The location of a Certificate Authority (CA) file on the local filesystem
; to use when verifying the identity of SSL/TLS peers. Most users should
; not specify a value for this directive as PHP will attempt to use the
; OS-managed cert stores in its absence. If specified, this value may still
; be overridden on a per-stream basis via the "cafile" SSL stream context
; option.
;openssl.cafile=

; If openssl.cafile is not specified or if the CA file is not found, the
; directory pointed to by openssl.capath is searched for a suitable

; certificate. This value must be a correctly hashed certificate directory.
; Most users should not specify a value for this directive as PHP will
; attempt to use the OS-managed cert stores in its absence. If specified,
; this value may still be overridden on a per-stream basis via the "capath"
; SSL stream context option.
;openssl.capath=

[ffi]

; FFI API restriction. Possible values:
; "preload" - enabled in CLI scripts and preloaded files (default)
; "false" - always disabled
; "true" - always enabled
;ffi.enable=preload
